

Activate Purview to Discover, Classify, & Protect Your Sensitive Data.

Turn existing Microsoft 365 licensing into actionable data protection controls quickly and effectively.

Microsoft Purview is often licensed but underutilized, leaving sensitive data unclassified and unprotected across Microsoft 365. Without proper configuration, organizations lack the controls needed to prevent data loss, enforce protection policies, and manage data exposure in an AI-driven environment.

The Purview Quick Start is a focused, outcome-driven engagement designed to rapidly activate core data security capabilities. By implementing foundational controls such as sensitivity labeling and data loss prevention (DLP), organizations gain immediate visibility into risk and begin enforcing protection where it matters most.

Our Approach

We deliver a structured, rapid deployment focused on visibility and protection:

1. **Assess & discover:** Identify key data sources, review current configurations, and uncover sensitive data exposure.
2. **Design & align:** Develop a data classification framework and define protection use cases aligned to business and regulatory requirements.
3. **Configure & align:** Develop a data classification framework and define protection use cases aligned to business and regulatory requirements.
4. **Validate & tune:** Test and refine configurations to ensure controls are effective while maintaining usability.
5. **Enable & transition:** Deliver training, documentation, and a prioritized roadmap to support continued maturity and expansion.

Microsoft Purview Quick Start Highlights & Benefits

What You Get

-  A defined and deployed data classification framework aligned to your business
-  Configured data protection controls to reduce data loss risk
-  Visibility into sensitive data across key Microsoft 365 workloads
-  A prioritized roadmap for expanding data protection and maturity
-  Executive summary and stakeholder presentation
-  End-user and administrator training materials

Key Benefits

-  Reduce the risk of sensitive data exposure across Microsoft 365
-  Establish consistent data classification across users and workloads
-  Improve visibility into where sensitive data exists and how it is being used
-  Enable safer collaboration by reducing accidental data sharing
-  Lay the groundwork for secure AI adoption and future data security maturity
